	DATE: 06th September 2026		
DEVICE SPECS: (Browser, RAM, Total no. of pkts, Memory size): Brave, 12GiB, 2000, 1.1 G			
PACKETS	**OBSERVATIONS**	**ISSUES IN COTS SOFTWARES**	
1-100	No lag on any tab, graphs were smooth, No lag on csv table	N.A	
101-200	No lag on any tab, graphs were smooth, No lag on csv table	N.A	
201-300	No lag on any tab, graphs were smooth, No lag on csv table	N.A	
301-400	Home page was lagging while scrolling (can be a browser issue)	N.A	
401-500	Home page along with tab swtiching was lagging while scrolling (can be a browser issue)	N.A	
501-600	Home page along with tab swtiching was lagging while scrolling (can be a browser issue)	Slight lag and delayed rendering was observed with Maps (3D as well as 2D	
601-700	Home page along with tab swtiching was lagging while scrolling (can be a browser issue)	Slight lag and delayed rendering was observed with Maps (3D as well as 2D	
701-800	Home page along with tab swtiching was lagging while scrolling (can be a browser issue)	Significant lag and delayed rendering was observed with Maps (3D as well as 2D	
801-900	Home page along with tab swtiching was lagging while scrolling (can be a browser issue)	Significant lag and delayed rendering was observed with Maps (3D as well as 2D	
901-1000	Home page along with tab swtiching was lagging while scrolling (can be a browser issue)	Significant lag and delayed rendering was observed with Maps (3D as well as 2D	
1001-1100	CSV table and CSV tab was smooth no lag was observed since start, CSV -> Home/Graphs, delayed rendering was observed, along with laggy scrolling	Significant lag and delayed rendering was observed with Maps (3D as well as 2D	
1101-1200	When switching between tabs, significant freezing of components was observed	Same as above	
1201-1300	When switching between tabs, significant freezing of components was observed	Same as above	
1301-1400	UI froze starting from around 1350th pkt, barely responsive	Same as above	
1401-1500	UI froze starting from around 1350th pkt, barely responsive	Same as above	
1501-1600	UI froze starting from around 1350th pkt, barely responsive	Same as above	
1601-1700	Some packets were not even being rendered properly, getting completely skipped on the home tab	Same as above	
1701-1800	Some packets were not even being rendered properly, getting completely skipped on the home tab	Same as above	
1801-1900	Some packets were not even being rendered properly, getting completely skipped on the home tab	Same as above	
1901-2000	Some packets were not even being rendered properly, getting completely skipped on the home tab	Same as above	
CONCLUSION: Initially at the start the UI was responsive with no lag or any delayed rendering. After around 400-500 packets it started showing some lag esp. while switching the tabs. Near the end of the csv file like around 1500+ pkt the UI was barely responsive, though the CSV table was very smooth without any lag, but the other components i.e graphs, map even 3D plot were very laggy. The UI started to freeze after switching the tabs. But after completing the csv file, it was all normal. Hence, there are several issues related to rendering, memory and browser.			
Memory consumption after the test was upto: **1.9 GBs** (though there were other tabs also but as compared to chromium this is v			
	Date: 12th September 2026 (After the updates as required since Test 01)		
Device Spec: (BROWSER, TOTAL no. of PKTS, MEMORY): Chromium, 2000, 12GiB			
Packets	**MEMORY / CHROMIUM**	**ISSUES in COT Software**	
1-150	81 % / 652.25	**N.A**	
151-300	81 % / 657.2	**N.A**	
301-450	81 % / 663.5	**N.A**	
451-600	80 % / 672.4	**N.A**	
601-750	81 % / 725.2	**N.A**	
751-900	81 % / 742.1	**N.A**	Peak Memory consumption @751 pkt
901-1050	76 % / 635.8	**N.A**	Reduction in Memory Consumption
1051-1200	76 % / 666.4	**N.A**	Reduction in Memory Consumption
1201-1350	77 % / 705.5	**N.A**	
1351-1500	75 % / 634.7	**N.A**	
1501-1650	74 % / 628.7	**N.A**	
1651-1800	73 % / 568.0	**N.A**	
1801-1950	73 % / 564.0	**N.A**	Least memory consumption @1801 pkt
1951-2000	70 % / 424.0	**N.A**	After the packets are over
Conclusion: Using 900 pkt window (15 min data) in memory at a time and removing the console.log() statements from the console window, significantly improved the performance of the GUI as compared to Test 01, this test was performed offline and on Chromium browser. Though, minute spike in Memory consumption was seen when the interacted with the dashboard components, but otherwise the overall performance was very much improved.
